# Landmarks & Roles

Abi Harrison-Nye

## What is it for?

Imagine trying to navigate a city with no street signs, where every building looks the same. That is what a website feels like to a screen reader user without Landmarks and Roles.

- Landmarks: These are like zones on a map. They tell the user 'This is the Navigation' or 'This is the Main Content'
- Roles: These are like name tags. They tell the user exactly what an item is

## How to support it

The best way is to use semantic HTML (standard HTML tags). When you use the right tag, you get the Landmark or Role for free.

- Landmarks: Use `<nav>` for menus and `<main>` for your main content
- Roles: Use `<button>` for buttons and `<a>` for links

You can use code to force a plain box (`<div>`) to act like a `<button>`, but it's risky and takes much more work.
