Time Limits

Abi Harrison-Nye

What is it for?

Time limits refer to when a page sets a time limit on doing a certain action. This is often seen while filling in forms, or whilst making a purchase.

To make time limits accessible, WCAG 2.2 requires (Level A) that users can turn a time limit off, change it to at least 10 times its length, or get a warning and at least 20 seconds to extend it.

Time limit considerations are most important for users with motor skills impairments, users with cognitive difficulties and screen reader users.

How to support it

Ensure that any time limits you use can be manually extended. Also ensure that the implementation of those time limits isn't done in a scary or anxiety-inducing manner.
